

Incident Escalation Report

Incident Details

Incident ID: #12345

Date: 14/04/2026

Analyst: Francesco Mariani

Severity: High

Status: Escalated to Incident Response Team

Executive Summary

What

Potential privilege escalation and persistence-related activity was detected on the monitored Ubuntu server.

Who

Suspicious activity was identified on the monitored endpoint through Wazuh SIEM alerts.

Impact

The activity suggests a potential compromise of a legitimate user account with unauthorized privileged access and persistence mechanisms.

Technical Details and Analysis

SIEM Alerts Triggered

- Failed sudo authentication attempts

- Successful privilege escalation alerts
- User account creation alerts

Timeline of Events

1. Multiple failed attempts to execute privileged commands using sudo
2. Successful privilege escalation to root access
3. Creation of a new user account (backdoor_user)
4. Correlated alerts generated by Wazuh SIEM

Indicators of Suspicious Activity

- Repeated failed sudo attempts
- Unauthorized privilege escalation
- Creation of a persistence-related user account

Analysis Summary

The detected behavior is consistent with a post-compromise scenario involving unauthorized privileged activity and persistence establishment.

The sequence of correlated events strongly suggests misuse of elevated privileges on the monitored system.

Containment and Mitigation Actions

Immediate Actions

- Incident validated through SIEM alert correlation
- Activity documented and escalated according to SOC procedures

Verification

- Wazuh successfully correlated all suspicious events
- Relevant logs and alerts were preserved for further investigation

Isolation

No direct containment or isolation actions were performed during this phase.

The incident was escalated to the Incident Response Team for further investigation and remediation.

Recommendations and Next Steps

Recommendations

- Restrict and monitor sudo privileges
- Enforce strong password policies
- Implement multi-factor authentication (MFA)
- Monitor failed privilege escalation attempts
- Regularly audit user accounts and permissions
- Maintain centralized SIEM monitoring and alert correlation

Escalation

The incident has been escalated to the Incident Response Team for:

- Further investigation
- Containment activities
- Root cause analysis
- Remediation and recovery

Conclusion

The SIEM successfully detected and correlated suspicious privileged activity on the monitored Ubuntu server.

This report demonstrates a structured SOC-oriented incident analysis and escalation workflow using Wazuh SIEM in a controlled lab environment.
